

ROOTS-AI™

Design Compliance Review and Consolidated Feedback

Review of the live PUB-01 implementation against the approved Visual Direction and Golden Screen Acceptance Brief and the PUB-01 Functional Reference.

REVIEW OUTCOME	NOT APPROVED AS A GOLDEN SCREEN OR PRODUCTION-READY RELEASE
----------------	---

Review item	Details
Live implementation	https://rootaidevelopment.vercel.app/
Controlling design source	ROOTS-AI_Visual_Direction_and_Golden_Screen_Acceptance_Brief_v1.0_FINAL
Controlling functional source	PUB-01_Functional_Reference_v1.0
Prepared for	Baseline IT Development Team
Prepared by	Dr. Nour Holly, Founder, ROOTS-AI™
Document status	Consolidated review for corrective implementation and resubmission

Dear Baseline IT Development Team,

Thank you for the development update and for deploying the current build. We reviewed the live implementation carefully against the two latest approved design-control documents listed above. This document consolidates the complete design, content, interaction, accessibility and submission feedback that should govern the next correction cycle.

The current build is a useful initial implementation of the page structure. However, it is not yet an approved Golden Screen and it should not be described as production-ready. The main issue is not a preference for a different colour or a small UI adjustment. The current page remains substantially closer to the functional reference layout than to the premium, proprietary ROOTS-AI visual system required by the approved brief.

Please treat the findings below as one consolidated response. They replace any earlier informal design comments where the latest two source files provide a more precise requirement.

Regards,

Dr. Nour Holly
Founder, ROOTS-AI™

1. Executive conclusion

The live page contains most of the major PUB-01 content zones in broadly the correct order, but it does not meet the approved visual, content, interaction or delivery threshold. The implementation is structurally recognisable, yet the approved copy has been materially altered, several required links and states are absent, one critical sample-report interpretation is incorrect, and the proprietary visual language has not been created.

Key audit results

- The nine logical PUB-01 zones are broadly represented, so the page is not being rejected for lacking a basic skeleton.
- In a strict sample of 37 controlled content checkpoints, only 10 matched exactly; 27 were changed or missing. This represents approximately 27% exact-text fidelity.
- The sample report displays 61/100 as Optimized, while the approved reference requires 61/100 as Strained. This is a critical semantic defect.
- The page does not contain the original ROOTS-AI signature visual required by both controlling documents.
- Required report states, navigation items, footer links, accessibility elements and the approved assessment route are incomplete or incorrect.
- The mandatory Figma and Golden Screen submission package was not included in the progress update.

PROVISIONAL SCORE	34 / 100 - below the required 85 / 100 pass threshold
----------------------	---

This score is provisional because the required Figma package, mobile compositions and documented accessibility evidence were not submitted. A final acceptance score can only be issued after the complete Golden Screen package is delivered and tested.

Acceptance scorecard

Criterion	Available	Score	Assessment
Visual quality and premium character	15	7	Clean, but basic and template-like rather than premium and scientific.
Signature impact and distinctiveness	20	3	No proprietary seven-domain signature expression; generic ring/card treatment.
Hierarchy and comprehension	15	10	General section order is understandable, but controlled meaning has changed.
Data storytelling	15	4	Generic rings and bars do not explain biological relationships or uncertainty.
Baseline fidelity	15	5	Broad zones exist, but copy, names, routes and states deviate materially.
Responsive design	10	3	Responsive claims exist, but required 360/768/1024/1440 evidence is absent.
Accessibility	5	2	Some implementation signals may exist; required skip link and test evidence are absent.
Figma and handoff	5	0	Required design and handoff package not submitted.
TOTAL	100	34	Does not pass the Golden Screen gate.

2. Authority and scope of this review

The two files used for this review serve different purposes and must be applied together:

- The Visual Direction and Golden Screen Acceptance Brief controls the required design character, signature impact, design process, responsive evidence, accessibility expectations, Figma handoff and 85/100 acceptance gate.
- The PUB-01 Functional Reference controls approved content, structure, required elements, destinations, user flow and interaction states. It explicitly states that it is not the final visual design.

Accordingly, the functional HTML may be used to preserve the approved content and flow, but its placeholder geometry, basic card system and temporary data visualisation must not be reproduced as the final visual language.

Scope boundary

This document is a design and PUB-01 compliance review. It does not certify Supabase configuration, database security, deterministic scoring, the full 73-question assessment, complete 19-section reporting, PDF parity, legal compliance, production monitoring or backend readiness. Those matters require the separate Phase 1 technical and acceptance documents and their own evidence.

3. Detailed findings and required corrections

3.1 Golden Screen workflow and approval gate

- The approved brief requires a visual direction board and two lightweight PUB-01 concepts before the selected direction is developed as a complete 1440px and 360px Golden Screen in Figma.
- Written Golden Screen approval must occur before visual production is expanded across downstream pages.
- The current update reports responsive pages, page creation and a production-ready deployment, but it does not include the mandatory visual-direction concepts, selected Golden Screen, Figma prototype, tokens, states, responsive annotations or asset register.

Required correction: Treat the live build as an implementation draft. Return to the PUB-01 Golden Screen gate, submit the required design package, and obtain written approval before carrying the visual system across other pages.

3.2 Overall visual character

- The required character is premium, scientific, human, data-rich and distinctive, with strong hierarchy, purposeful whitespace, subtle depth, semantic colour, confident typography and restrained motion.
- The current page relies heavily on repeated white outlined cards, broad empty spaces, generic rings and bar charts. The presentation is clean, but it is visually safe and interchangeable with many general wellness or SaaS templates.
- The current system does not yet create a memorable ROOTS-AI identity when the logo is removed, which is an explicit signature-impact expectation in the brief.

Required correction: Develop a proprietary visual system rather than refining the current card template. Use purposeful biological relationships, richer data hierarchy, controlled depth, more distinctive typography and an original visual grammar across the page.

3.3 Hero and first-five-second impact

- The approved hero headline is present, and the principal calls to action are represented.
- The paragraph differs from the controlled reference, including its punctuation and exact phrasing.
- The right-side hero element is a generic status card with a circular progress graphic. It does not provide the commanding, proprietary first impression required by the visual brief.
- The reference explicitly identifies the signature area as a placeholder and instructs the vendor to create an original ROOTS-AI expression rather than reproduce placeholder geometry.

Required correction: Preserve the approved copy exactly and replace the generic hero card with an original signature expression that communicates the connected biological system and immediately distinguishes ROOTS-AI.

3.4 Proprietary biological signature visual

- The signature expression must communicate Biological State, seven connected domains, drivers, protective factors, confidence, opportunity, uncertainty and boundaries.
- It must also help distinguish deterministic scoring from governed AI explanation.
- The current ring and progress-card treatment does not communicate these relationships and could be used in any wellness application.

Required correction: Create one original, reusable ROOTS-AI visual language showing the seven-domain network and the hierarchy between state, contributors, protection, confidence and opportunity. It should remain recognisable across reports, public pages and product screens.

3.5 Navigation and destination fidelity

- The approved desktop navigation includes How It Works, Platform, Research, Healthcare Professionals, Example Report and Start Your Assessment.
- Healthcare Professionals is missing from the current primary navigation, and the order differs from the reference.
- The approved assessment destination is /assessment/start. The current calls to action use /assessment-start.

Required correction: Restore the approved navigation item and order unless a formal content change is approved. Update every assessment call to action to the controlled /assessment/start destination and verify that the destination resolves correctly.

3.6 Trust strip

- The four trust items are broadly present and represent one of the strongest areas of structural fidelity.
- Their final spacing, icons, hierarchy and responsive treatment must still be part of the approved visual system rather than remain a literal functional-reference treatment.

Required correction: Retain the controlled wording and redesign the strip as part of the proprietary visual system. Confirm legibility, wrapping and touch behaviour at all required breakpoints.

3.7 Six platform feature cards

- The six-card structure is represented, but several approved headings and descriptions have been rewritten, expanded or simplified.
- Educational, not diagnostic has been changed to Educational insights, weakening a required boundary statement.
- AI assists with explanation, not calculation and the report language concerning answers and limitations are not preserved exactly.
- Additional unapproved language has been introduced, including variations such as Your data stays yours.

Required correction: Restore the six approved headings and descriptions exactly. Treat all additional copy as a proposed change requiring written approval rather than silently substituting it during implementation.

3.8 Seven biological domains

- Only Metabolic Resistance™ and Stress Load™ retain their controlled domain names exactly.
- Five domain names have been shortened: Hunger & Satiety Signals™ to Hunger Signals; Sleep Recovery Index™ to Sleep Recovery; Circadian Health Score™ to Circadian Health; Inflammation Burden Index™ to Inflammation Burden; and Biological Safety Signals™ to Biological Safety.
- The descriptions have also been materially simplified. This removes scientific boundaries and meaning, including the explicit clarification that Inflammation Burden Index is a non-specific symptom burden and not a laboratory or clinical inflammation measure.

Required correction: Restore all seven controlled names, trademark styling and descriptions exactly. Preserve the scientific limitations and ensure that the design communicates seven connected domains rather than seven unrelated cards.

3.9 How It Works

- The latest controlling HTML contains four combined cards, not six. The four-card structure in the current page is therefore correct.
- Analyse has been changed to Analyze, and Explain & Render has been shortened to Explain.
- The descriptions omit important requirements: approved response normalisation, preservation of N/A, seven-domain and derived-indicator calculation, driver and confidence selection, eligible content selection, approved explanation objects, and web/PDF output from the same immutable report.

Required correction: Keep the four-card structure, restore the controlled labels and full approved descriptions, and visually separate deterministic calculation from governed explanation and rendering.

3.10 Example-report preview and interpretation

- The score 61/100 and driver values 75, 68 and 62 are present.
- The approved interpretation for 61/100 is Strained. The live page displays Optimized. This is a direct and critical contradiction in the meaning of the sample result.
- The approved boundary statement is: This is a questionnaire summary, not a medical risk probability. The current wording has been changed to a general diagnosis disclaimer.
- The reference requires loaded, loading and error states, with an available Retry action. Loading, error and retry are not available in the live page structure reviewed.

Required correction: Change 61/100 to Strained, restore the exact boundary statement, implement all required states and retry behaviour, and ensure that the same approved interpretation remains consistent wherever the sample report appears.

3.11 Pilot Programme content

- The headline and main call to action are represented, but the approved explanation and participation conditions are simplified.
- The current presentation does not preserve the complete statements covering age 18+, voluntary participation and withdrawal, educational use without medical care, separate consent for research and feedback, and no payment for the approved cohort.
- The reference to weight resistance has also been reduced or removed.

Required correction: Restore the complete approved pilot wording and all five participation conditions. Do not merge, soften or omit consent and boundary language for visual brevity.

3.12 Footer, legal boundary and information architecture

- The approved educational and medical boundary statement is not preserved exactly.
- Contact, Blog and AI Disclaimer links required by the reference are missing.
- The footer assessment call to action uses the incorrect /assessment-start route.
- The bottom legal links appear crowded or visually overlapping in the reviewed desktop rendering.

Required correction: Restore the controlled boundary statement and required links, correct the route, and redesign the footer spacing so that all legal and navigational items remain clear and non-overlapping at every breakpoint.

3.13 Required interaction and report states

- The reference requires an accessible mobile drawer, Escape-to-close behaviour, focus trapping, focus return, a sticky header after scrolling, report-state switching, reduced-motion support and no horizontal body overflow.
- A general statement that pages are responsive and animated is not evidence that these behaviours meet the acceptance criteria.
- The required loading, error and retry report states are visibly absent from the current implementation reviewed.

Required correction: Provide a state matrix and short evidence capture demonstrating each interaction on desktop and mobile. Include keyboard testing and the loaded/loading/error/retry sequence rather than only the default loaded view.

3.14 Accessibility

- The approved functional reference contains a Skip to main content link. It is absent from the live page reviewed.
- No acceptance evidence was supplied for keyboard-only navigation, visible focus, focus order, focus trapping and return, screen-reader names, colour contrast, touch-target sizes or reduced-motion behaviour.
- The visual brief requires WCAG 2.2 AA as a design and implementation expectation.

Required correction: Restore the skip link and submit an accessibility checklist with evidence for the required behaviours. Accessibility must be shown in the 360px and 1440px Golden Screen states, not deferred until the end of development.

3.15 Responsive design

- The brief requires deliberate designs and validation at 360px, 768px, 1024px and 1440px.
- The 1440px and 360px compositions must be designed first, and mobile must preserve meaning rather than merely stack every desktop card vertically.
- No approved Figma frames, responsive annotations, comparison captures or device-test evidence were included in the update.

Required correction: Submit complete 1440px and 360px Figma compositions first, followed by the 768px and 1024px adaptations after Golden Screen approval. Show how relationships, data hierarchy, navigation and footer information recompose at each width.

3.16 Visual assets, imagery and iconography

- The visual brief expects deliberate scientific imagery, iconography and data-visualisation rules, with asset and licensing records.
- The current page contains very limited original visual material beyond the logo and generic interface graphics.
- No asset-source or licence register was submitted.

Required correction: Define the approved iconography and imagery system, identify all third-party assets, provide licence details, and ensure that the ROOTS-AI signature expression is original and editable.

3.17 Figma, components and handoff

- The required submission includes editable Figma source, component and token definitions, interaction states, a prototype, responsive notes and an asset/licence list.
- The progress report mentions implementation work but does not include these design deliverables.
- Without them, the Golden Screen cannot be reviewed or accepted under the stated process.

Required correction: Provide one organised Figma file containing the direction board, two initial concepts, selected 1440px and 360px Golden Screen frames, component variants, tokens, states, prototype links, responsive notes and asset register.

3.18 Use of the production-ready statement

- Successful compilation and Vercel deployment show that a build can be produced and viewed; they do not establish product, design, accessibility, content, security or UAT readiness.
- The current build still contains blocking design and content defects and lacks the required acceptance evidence.

Required correction: Please describe this build as a development preview or implementation draft until the complete Phase 1 Definition of Done and the Golden Screen acceptance gate have both been satisfied.

4. Controlled-content correction matrix

The following matrix captures the most material content changes observed in the live PUB-01 implementation. It is not permission to change unlisted copy. The approved HTML remains the authoritative source for all controlled text and destinations.

Area	Approved requirement	Observed implementation	Status
Assessment route	/assessment/start	/assessment-start	Incorrect
Header	Healthcare Professionals included	Missing from primary navigation	Missing
Feature boundary	Educational, not diagnostic	Educational insights	Changed
Domain	Hunger & Satiety Signals™	Hunger Signals	Changed
Domain	Sleep Recovery Index™	Sleep Recovery	Changed
Domain	Circadian Health Score™	Circadian Health	Changed
Domain	Inflammation Burden Index™	Inflammation Burden	Changed
Domain	Biological Safety Signals™	Biological Safety	Changed
Process label	Analyse	Analyze	Changed
Process label	Explain & Render	Explain	Changed
Report state	61/100 - Strained	61/100 - Optimized	Critical
Report boundary	Questionnaire summary; not a medical risk probability	Changed to general diagnosis wording	Changed
Report behaviour	Loaded, loading, error and Retry	Loading/error/retry not present	Missing
Pilot consent	Five complete approved conditions	Simplified and incomplete	Missing/changed
Footer	Contact, Blog and AI Disclaimer	Missing	Missing
Accessibility	Skip to main content	Absent	Missing

Approved seven-domain wording

Code	Controlled name	Controlled description
MR	Metabolic Resistance™	Self-reported resistance to expected weight change and activity-related metabolic context.
HS	Hunger & Satiety Signals™	Hunger, craving, fullness and post-meal response patterns.
SR	Sleep Recovery Index™	Sleep duration, continuity and perceived restoration.
CH	Circadian Health Score™	Alignment of light, screen, meal and sleep timing.
SL	Stress Load™	Perceived tension, cognitive activation and stress-linked eating.
IB	Inflammation Burden Index™	Non-specific symptom burden; not a laboratory or clinical inflammation measure.
BS	Biological Safety Signals™	Perceived energy, appetite drive and resistance signals.

Approved four-step process

Step	Controlled label	Required meaning to preserve
1	Assess	Complete the structured 73-question assessment.
2	Validate	Normalise approved responses and preserve N/A.
3	Analyse	Deterministic rules calculate seven domains and derived indicators, then select drivers, confidence and eligible content.
4	Explain & Render	Governed AI converts approved explanation objects, and web/PDF are produced from the same immutable report.

Clarification: an earlier informal comment referred to six distinct process steps. That comment is superseded. The latest PUB-01 Functional Reference controls, and it specifies four combined cards.

5. Blocking defects preventing approval

1. The current aesthetic remains generic and insufficiently distinctive for the required ROOTS-AI signature standard.
2. The original seven-domain signature visual has not been created.
3. The sample score 61/100 is assigned the incorrect interpretation Optimized instead of Strained.
4. Controlled domain names, descriptions, boundary language and other approved copy have been changed without approval.
5. Required loading, error and retry states are absent.
6. The controlled assessment route is not used.
7. Required navigation and footer items are missing.
8. The approved skip link is missing, and accessibility evidence has not been provided.
9. The required 1440px and 360px Golden Screen Figma package has not been submitted.
10. Downstream page production has progressed before written Golden Screen approval.

6. Required resubmission package

For the next review, please provide one organised submission containing the following materials. This allows the team and ROOTS-AI to review the same evidence once, avoid fragmented feedback and close the Golden Screen gate efficiently.

Deliverable	Required evidence
Visual direction board	One board defining colour, typography, spacing, depth, imagery, iconography, motion and data-visualisation principles.
Two PUB-01 concepts	Two lightweight but meaningfully different visual directions using the approved content and structure.
Selected Golden Screen	Complete editable 1440px and 360px PUB-01 frames in Figma.
Responsive adaptations	768px and 1024px frames after written approval of the selected direction.
Signature expression	Original seven-domain biological-state visual and its behaviour across desktop and mobile.
Component system	Reusable components, variants, design tokens and all required interaction/report states.
Prototype	Navigation, mobile drawer, focus behaviour and report-state interactions.
Content correction log	Confirmation that approved PUB-01 copy, names, values, boundary statements and destinations have been restored exactly.
Accessibility evidence	WCAG 2.2 AA checklist covering keyboard, focus, contrast, labels, targets and reduced motion.
Asset register	Source, ownership, licence and editability status of every image, icon, font and third-party asset.
Visual comparison captures	Side-by-side 360px, 768px, 1024px and 1440px screenshots with no horizontal overflow or content loss.
Deployment label	Identify the next build as a development preview until the formal acceptance gates are passed.

7. Acceptance and retest conditions

- The corrected PUB-01 must score at least 85/100 under the approved rubric.
- No blocking defect may remain, regardless of the numerical score.
- All approved copy, domain names, sample values, boundary statements, destinations and required states must match the functional reference.
- The design must show a proprietary ROOTS-AI visual language and must not remain a direct visual evolution of the functional HTML.
- The 360px and 1440px Golden Screen designs must be approved in writing before downstream visual production resumes.
- Responsive, accessibility and interaction claims must be supported by reviewable evidence, not only by implementation statements.

8. Requested confirmation

Please confirm receipt of this consolidated review and provide a single corrective-action response containing:

1. the owner responsible for each correction area;
2. the expected date for the revised visual-direction concepts;
3. the expected date for the complete 1440px and 360px Golden Screen submission;
4. a list of any item the team believes cannot be implemented as specified, with the reason and proposed alternative; and
5. confirmation that the live build will be treated as a development preview until written acceptance is issued.

Once the complete corrected package is submitted, ROOTS-AI will review it against the same two controlling files and issue either written Golden Screen approval or one final consolidated exception list.
