

ROOTS-AI™

VISUAL DIRECTION & GOLDEN SCREEN ACCEPTANCE BRIEF

A controlled world-class design gate for Phase 1 implementation

Document version	1.0 — Final for Vendor Review and Acceptance
Applies to	ROOTS-AI™ Phase 1 MVP UI/UX implementation
Initial approval gate	PUB-01 Golden Screen
Issued by	Dr. Nour Holly, Founder, ROOTS-AI™

CONTROLLING INTERPRETATION

The existing SVG files remain authoritative for approved content, screen structure, required elements and user flow only. They are not authoritative for final visual styling, artistic direction, component appearance or design quality.

DECISION

Do not continue bulk production of the remaining screens until PUB-01 has passed the Golden Screen approval gate in writing.

01 / MANDATE

1. Purpose and Required Interpretation

This brief converts the approved ROOTS-AI™ product requirements into a controlled visual-design process. It protects the approved content, structure, functionality and user flow while requiring the vendor to apply its strongest professional UI/UX capability to the final visual execution.

The prior SVG references are functional and content wireframes. They clarify what must appear, how information is ordered and how the user moves through the product. They must not be treated as the final aesthetic benchmark or reproduced as visually finished screens.

REQUIRED LABEL FOR ALL EXISTING SVG REFERENCES**FUNCTIONAL AND CONTENT WIREFRAME — NOT A FINAL VISUAL DESIGN**

2. Authority and Conflict Order

The following order applies if two sources appear to conflict:

Priority	Controlled source	What it governs
1	Signed agreement and approved commercial terms	Controls contracted scope, ownership, delivery, handover, warranty, fixed price and schedule.
2	Controlled Phase 1 implementation baseline	Controls approved product content, functionality, logic, screen requirements, states and acceptance obligations.
3	This Visual Direction Brief	Controls the visual-quality target, design process and PUB-01 design gate.
4	Approved PUB-01 Golden Screen in Figma	Becomes the visual-system reference after written approval; it cannot remove or modify baseline requirements.
5	Approved downstream screens	Must inherit the approved system and remain traceable to the controlled baseline.

No meeting comment, chat message, mock-up or design preference changes the controlled requirements unless ROOTS-AI™ approves that change in writing.

3. Product Positioning

ROOTS-AI™ is a Biological Intelligence platform. It should not look like a generic wellness site, hospital portal, supplement store, questionnaire template or conventional dashboard. The experience must communicate scientific credibility, calm confidence, interpretive clarity and premium digital craftsmanship.

- Premium, but not decorative or luxurious at the expense of clarity.
- Scientific, but not cold, clinical or visually intimidating.
- Human, but not casual, childish or lifestyle-influencer oriented.
- Data-rich, but not crowded or spreadsheet-like.
- Distinctive, but never experimental at the expense of usability or accessibility.

02 / DIRECTION

4. Inspiration Principles — Learn, Do Not Copy

Reference	Principle to study	Boundary
Oura	Visual calm, restraint, premium simplicity and elegant pacing.	Do not copy rings, compositions, gradients, illustrations or proprietary interaction patterns.
Function Health	Clear presentation of complex health information and progressive disclosure.	Do not reproduce report structures, terminology, visualisations or component arrangements.
WHOOP	Score salience, actionable interpretation and strong connection between signals and decisions.	Do not copy score treatments, colour systems, charts or recovery conventions.
Apple Health	Clean hierarchy, accessibility, familiar interaction logic and disciplined information density.	Do not imitate Apple trade dress, iconography, card patterns or platform-specific visual identity.

NON-COPYING RULE

The submission must be recognisably ROOTS-AI™. Similarity to a reference is acceptable only at the level of quality principles, never at the level of copied expression, layout, assets or visual identity.

5. ROOTS-AI™ Signature Visual Narrative

The visual system should make the platform's own intellectual model visible. At minimum, the design language must be capable of expressing:

- Biological State: Optimized, Compensating, Strained and Dysregulated, without presenting a diagnosis.
- The seven health domains as a connected system, not isolated scores.
- Drivers, protective factors, confidence and opportunity as distinct information types.
- The connection between signals, adaptation, interpretation and next actions.
- A clear separation between deterministic scoring and governed AI-generated narrative.
- Scientific boundaries, uncertainty and non-diagnostic language without weakening usefulness.

6. Required Visual Character

Dimension	Required outcome
Hierarchy	Immediate recognition of the primary state, most important insight and next action.
Rhythm	Generous but purposeful whitespace; sections should feel paced, not empty or stretched.
Depth	Subtle layering, elevation and visual grouping; avoid excessive outlined boxes.
Colour	Meaningful semantic use with accessible contrast; avoid arbitrary gradients and decorative colour overload.
Typography	Confident editorial hierarchy with highly legible body text, numerals, labels and long-form interpretation.
Motion	Restrained and meaningful; use only to explain change, progress, relationship or system response.
Imagery	Original, licensed and scientifically appropriate; avoid generic stock-wellness clichés.

6.1 Signature Impact and Distinctiveness Requirement

The final ROOTS-AI™ experience must create an immediate and memorable first impression of scientific power, Biological Intelligence and technological distinction. It must go beyond clean usability and premium styling to establish a recognisable visual identity that could belong only to ROOTS-AI™.

PUB-01 must contain at least one original signature visual expression of the ROOTS-AI™ biological model—for example, a distinctive representation of Biological State, the seven connected health domains, or the relationship between signals, adaptation, drivers and protection. The exact expression is the vendor's design responsibility and must not imitate any named reference platform.

- A powerful and visually commanding hero experience that communicates category leadership within the first five seconds.
- A proprietary visual language for Biological Intelligence that can scale across public, assessment, report and administration screens.
- Memorable data storytelling rather than conventional dashboard charts, decorative graphs or repeated generic cards.
- Deliberate use of contrast, depth, composition, scale and motion to create impact without sacrificing comprehension.
- A coherent emotional balance of scientific authority, human reassurance and technological advancement.
- A recognisable design system that remains identifiably ROOTS-AI™ even when the logo is temporarily removed during review.

WORLD-CLASS QUALITY TEST

The selected direction must meet or exceed the named reference platforms in overall craft, hierarchy, clarity, responsiveness and perceived product quality while remaining wholly original. A design that is merely clean, modern, minimal or technically correct—but visually generic, overly safe, repetitive or lacking a memorable signature element—will not pass the Golden Screen approval gate.

7. Visual-System Requirements

The selected direction must resolve into an implementable design system, not a collection of attractive isolated screens.

- **Colour system.** Define primary, neutral and semantic palettes; status colours; surface hierarchy; dark/light behaviour if proposed; and accessible combinations.
- **Typography.** Define families, licences, weights, optical hierarchy, numeric treatment, line lengths, line heights and responsive scaling.
- **Layout and spacing.** Define grid, container widths, spacing scale, breakpoints, alignment rules and responsive section behaviour.
- **Components.** Define cards, navigation, buttons, inputs, progress, tabs, accordions, charts, notices, tooltips, empty states, validation and consent patterns.
- **States.** Include default, hover, focus, active, selected, disabled, loading, success, warning, error, empty and unavailable states where applicable.
- **Iconography and imagery.** Use one coherent style with documented licensing and production-ready assets.
- **Data visualisation.** Create reusable chart rules, legends, scales, annotations, thresholds and fallback behaviour.

8. Phase 0B Dependencies and Asset Control

Before visual production is scaled, the vendor must use or confirm the controlled identity, font, image and HTML-reference inputs made available by ROOTS-AI™. If any required source is missing, inconsistent, unlicensed or technically unsuitable, the vendor must raise one numbered reservation before implementation rather than inventing a silent substitute.

Input	Purpose	Vendor obligation
Brand identity	Approved logo variants, usage rules and trademark treatment.	Use supplied approved assets; identify any missing production format.
Fonts	Approved font families, weights, licences and fallbacks.	Confirm web and PDF availability before finalising typography.
Images/illustrations	Approved source assets and licensing status.	Do not introduce unlicensed or generic placeholder imagery into final delivery.
HTML reference	Content/structure reference and behavioural clues.	Treat as functional reference unless expressly marked as final visual authority.
design_tokens.json	Machine-readable visual constants.	Update only after the selected direction is approved and keep it aligned with Figma.
screen_catalog.json	Canonical screen IDs, routes, breakpoints and filenames.	Use as the delivery inventory and do not create undocumented IDs.

04 / GOLDEN SCREEN

9. PUB-01 Golden Screen Design Intent

PUB-01 is the visual-system proof point. The exact approved content, required elements and user flow remain controlled by the Phase 1 baseline. The design must demonstrate a coherent experience across the following functional zones, without omitting, rewriting or inventing product claims:

Zone	Role	Design intent
01	Header and navigation	Immediate orientation, restrained navigation and a clear primary action.
02	Hero and positioning	A distinctive statement of Biological Intelligence with credible visual presence.
03	Platform explanation	Explain the value and process progressively without a dense wall of text.
04	Seven-domain system	Show interconnected domains with clear relationships and accessible labels.
05	Biological State	Make state meaningful, calm and non-diagnostic; avoid fear-based colour coding.
06	Drivers and protection	Differentiate contributors, protective factors, confidence and opportunity.
07	Report/data preview	Demonstrate premium data storytelling, hierarchy and interpretive usefulness.
08	Trust and governance	Communicate scientific boundaries, privacy, governed AI and credibility.
09	Final action and footer	Conclude with one clear action and a complete, balanced footer.

CONTENT PROTECTION

The zone labels above describe design intent. They do not replace the canonical PUB-01 content or screen specification. Where naming differs, the controlled baseline governs the exact content and required elements.

10. Responsive Behaviour

The approved system must support the four controlled viewport widths: 360, 768, 1024 and 1440 pixels. Responsiveness means deliberate re-composition, not merely shrinking desktop elements.

- Design the 1440px and 360px extremes first for the Golden Screen gate.
- After the visual direction is approved, complete and validate the 768px and 1024px versions.
- Preserve content priority, meaning, navigation, interaction states and accessibility across widths.
- Avoid excessive mobile page length caused by stacking every desktop card without consolidation or progressive disclosure.
- Document reflow, collapsing, truncation, sticky behaviour, chart adaptation and touch targets in Figma.

11. Data Visualisation and Report Preview

Data visualisation must explain relationships and support decisions. Decorative charts, invented precision and visual complexity without interpretive value are not acceptable.

- Show the value, label, unit, range or reference context whenever the source data requires it.
- Use semantic colour consistently and never rely on colour alone to communicate status.
- Differentiate measured data, calculated scores, deterministic interpretations and AI narrative.
- Represent uncertainty or confidence explicitly where the controlled model requires it.
- Provide responsive alternatives for charts that cannot remain legible on mobile.
- Maintain conceptual and visual parity between web and PDF outputs.

12. Interaction, Accessibility and Technical Readiness

Area	Minimum requirement
Accessibility	Target WCAG 2.2 AA for contrast, keyboard access, focus visibility, labels, errors and meaningful alternatives.
Touch	Use practical mobile targets and spacing; controls must not depend on hover.
Focus	Every interactive component requires an intentional, visible focus state.
Forms	Labels, instructions, validation and recovery must be clear and persistent where needed.
Motion	Respect reduced-motion preferences and avoid animation that blocks comprehension or completion.
Handoff	Use editable, named and reusable Figma components, variants, variables/tokens and Auto Layout.
Implementation	The design must remain achievable within the approved technical architecture and schedule.

13. Required Submission Sequence

Stage A — Lightweight Direction Exploration

Submit one visual direction board and two lightweight PUB-01 visual direction concepts. These are not two complete production-ready pages. Each concept must be sufficient to demonstrate:

- Colour system and surface language.
- Typography and information hierarchy.
- Card/component character and depth.
- Data-visualisation style and report-preview logic.
- Imagery/illustration approach and licensing direction.
- A credible interpretation of the mobile experience.
- A short rationale explaining how the concept is distinctive to ROOTS-AI™.

Stage B — Selected PUB-01 Golden Screen

After ROOTS-AI™ selects one direction, develop that direction into a production-ready PUB-01 submission containing:

- Complete 1440px desktop design.
- Complete 360px mobile design.
- Linked Figma prototype for the required interactions.
- Relevant components, variants, tokens and states used on PUB-01.
- Responsive-behaviour notes and implementation annotations.
- Asset/licensing list for fonts, imagery, illustrations and icons.

Stage C — Controlled Expansion

Only after written approval of Stage B may the vendor complete PUB-01 at 768px and 1024px and then apply the approved design system to the remaining screens in the agreed delivery sequence.

APPROVAL BOUNDARY

Approval of a visual direction or Golden Screen confirms the visual system only. It does not waive any omitted content, requirement, state, interaction, security obligation, traceability item or contractual deliverable.

14. Prohibited Outcomes

- A direct visual reproduction of the existing SVG wireframes.
- A generic template, dashboard kit or wellness aesthetic with a ROOTS-AI™ logo added.
- A professionally clean but visually safe or forgettable design that lacks a commanding first impression, proprietary visual expression or memorable ROOTS-AI™ signature.
- Copying identifiable layouts, assets, charts, imagery or trade dress from the named references.
- Changing approved copy, product meaning, scores, claims, disclosures or flow without written approval.
- Using unlicensed fonts, images, illustrations, icons or third-party UI assets.
- Desktop-first screens that become excessively long, unclear or functionally reduced on mobile.
- Beautiful static frames that omit required states, interactions, validation, accessibility or implementation detail.
- Flattened, uneditable or poorly structured Figma files that cannot support development and handover.

15. Golden Screen Acceptance Score

Criterion	Weight	Evidence of acceptance
Visual quality and premium execution	15	Polish, proportion, restraint, consistency and world-class finish.
Signature impact and distinctive ROOTS-AI™ identity	20	Commanding first impression, proprietary visual expression and recognisable platform character without copying.
Hierarchy and comprehension	15	Primary state, value, evidence and action are immediately understandable.
Data storytelling	15	Complex information is meaningful, legible and actionable.
Baseline fidelity	15	Approved content, required elements and flow are preserved.
Responsive quality	10	1440px and 360px are deliberately composed and equivalent in meaning.
Accessibility	5	Contrast, focus, labels, targets and non-colour cues are credible.
Figma and handoff quality	5	Editable components, states, naming, tokens and annotations are usable.

Pass threshold: 85/100, with no blocking defect. A score above the threshold does not override a blocker.

Blocking Defects

- Any approved content, required element, route, state or critical interaction is missing or materially altered.
- The work is materially generic, copied or not recognisably ROOTS-AI™.
- The design is professionally clean but lacks a powerful first impression, proprietary visual expression or memorable ROOTS-AI™ signature.
- The mobile version is incomplete, materially inferior or inconsistent in meaning.
- Critical accessibility failure or unreadable data presentation.
- Unlicensed, inaccessible, non-editable or non-transferable design assets.
- The Figma source is not structured sufficiently for implementation and handover.

16. Execution, Change Control and Commercial Position

- This brief clarifies the required UI/UX quality and approval method within the already contracted Phase 1 scope.
- The required visual-direction work, Golden Screen design, revisions needed to pass the gate, responsive completion, component preparation and design documentation remain included in the fixed price and 30-calendar-day schedule.
- This process does not authorise an additional fee, schedule extension or reduction of scope.
- ROOTS-AI™ will provide consolidated written feedback at each defined gate. The vendor must resolve that feedback before scaling production.
- No remaining screen should be visually finalised before PUB-01 receives written approval.
- All approved source files, components, assets, licences, exports and documentation must be delivered under the ownership and handover terms of the signed agreement.
- Any genuine dependency or reservation must be disclosed once, in one complete numbered list, before acceptance of this brief.

17. Vendor Confirmation

Please reply with the following declaration, or provide one complete numbered list of reservations:

REQUIRED DECLARATION

"We have reviewed the ROOTS-AI™ Visual Direction & Golden Screen Acceptance Brief Version 1.0. We confirm that the existing SVG references will be treated as functional and content wireframes rather than final visual designs. We will submit the required visual direction board and two lightweight PUB-01 visual direction concepts before producing the selected production-ready PUB-01 Golden Screen, and we will not proceed with the remaining screens until written approval is issued. We confirm that this work will preserve the Controlled Baseline and will be completed within the existing fixed price and 30-calendar-day schedule, subject only to the numbered reservations below."
