

ROOTS-AI™ C-06 Executable Technical Baseline v1.0.1 - CONTROLLED CORRECTION

Document ID: ROOTS-C06-TECH-001 | Controlled correction to v1.0.0

This correction sheet is integral to the attached v1.0.0 release and supersedes only the source-version, deterministic-export and Golden Test authority statements identified below. All unaffected API, schema, database, RLS, ERD/role, security and technical-readiness requirements remain binding.

1. Canonical executable-source versions

Where the attached release refers generically to C-01 and C-02, the executable data release shall be derived from **C-01 Canonical Question Bank v1.0.1** and **C-02 Canonical Scoring Rules and Golden Tests v1.0.1**. Their final approved XLSX files are the canonical executable sources. Export metadata shall record the exact source filename/version and final SHA-256 checksum used to generate each JSON/CSV artifact.

2. Question/scoring export integrity

The question/scoring JSON and CSV exports shall reproduce the approved C-01/C-02 v1.0.1 content and deterministic rules without manual reinterpretation. Acceptance retains the canonical counts **73 questions / 13 modules / 40 scoring-eligible questions**, and the export source hashes must match the final controlled source files.

3. Golden Test authority

The executable Golden Test artifact may retain an implementation filename such as **golden_tests.v1.0.0.json** only if its embedded release metadata identifies C-02 v1.0.1 as the canonical source; alternatively it may be versioned to match the controlled release. In either case, **all 30 tests must match the C-02 v1.0.1 canonical expected outputs exactly**.

4. Deterministic driver requirements within the 30 tests

Exact Golden Test conformance includes the corrected deterministic driver behavior: eligible domains only, descending score ranking, fixed tie order **MR, HS, SR, CH, SL, IB, BS**, co-primary behavior when the top two eligible scores differ by no more than 3 points, a co-primary pair rendered as one output entry, no duplication, no ineligible/null fallback and no LLM selection. The **BIO_STATE** identifier represents Biological State; **BS** remains exclusively Biological Safety Signals™. Canonical rounding rules from C-02 v1.0.1 also apply.

5. No architectural or commercial change

This correction does **not** alter the documented OpenAPI 3.1 contract, five JSON Schema 2020-12 files, three ordered SQL migrations, eight required logical application tables, role assignments/contact enquiries, RLS on protected relations, 12 negative RLS tests, research-consent requirement, HMAC-SHA-256 pseudonymization, Architecture Gate evidence, commercial baseline or delivery schedule. It is a controlled source/version-integrity correction only.

Precedence: where the attached v1.0.0 pages conflict with this correction on the matters above, v1.0.1 controls.

ROOTS-AI™ Phase 1 MVP

C-06 Executable Technical Baseline

Document ID	ROOTS-C06-TECH-001
Version	1.0.0
Issue date	23 July 2026
Owner	ROOTS AI HEALTH SYSTEMS, Inc.
Status	APPROVED IMPLEMENTATION INPUT RELEASE
Commercial baseline	RM 15,000 fixed fee • 30 calendar days • 7-day UAT

This controlled annex completes the approved ROOTS-AI Phase 1 baseline. It does not replace C-01 through C-05; it makes their implementation inputs directly importable and testable.

1. Binding technical package

Area	Importable files	Acceptance
API	api/openapi.v1.yaml	OpenAPI 3.1 validation; every route authorized and versioned
Schemas	five JSON Schema 2020-12 files	Positive/negative validation fixtures pass
Database	three ordered SQL migrations	Clean Supabase project migrates without manual edits
RLS	policies + 12 negative tests	Cross-user and cross-role access is blocked
Data	question/scoring JSON + CSV exports	73/13/40 counts and source hashes match
Golden tests	golden_tests.v1.0.0.json	30 expected outputs match exactly
ERD/roles	erd.svg + role_permissions_matrix.csv	Architecture Gate review

2. API contract

- System: GET /health
- Authentication: POST /auth/magic-link
- Assessment: create, retrieve, archive, save responses, submit and poll status
- Reports: authorized JSON retrieval and short-lived PDF access
- Contact: validated, rate-limited enquiry intake
- Admin: participants, report jobs/retry, configuration lifecycle, audit and research export

3. Database and access isolation

The migrations implement the eight required logical application tables, plus role assignments and contact enquiries. RLS is enabled on every protected relation. Browser roles cannot create scores, reports or audit records. Research export uses explicit active research consent and HMAC-SHA-256 pseudonymization with the secret outside source code.

4. Deterministic data release

C-01 and C-02 remain the scientific/product source of truth. The JSON and CSV files are byte-derived exports from the approved workbooks. The release metadata records the source SHA-256, approval record and the correct limitation: approved for the proprietary educational beta, not represented as a clinically validated diagnostic instrument.

5. Definition of technically ready

A competent implementation team can import the data, validate payloads, migrate a clean Supabase project, implement the documented endpoints and execute all golden and RLS tests without inventing a question, score, threshold, role or table. Environment secrets, provider project IDs and production credentials remain secure deployment inputs and are never embedded in handoff files.
