

ROOTS-AI™ Phase 1 Detailed Pre-Qualification Scope & Mandatory Delivery Conditions v1.0.1 — CONTROLLED CORRECTION

Controlled correction to the issued v1.0 pre-qualification scope

This correction is integral to the attached v1.0 release and supersedes only the matters stated below. All unaffected technical, security, delivery, acceptance, handover and out-of-scope conditions remain binding.

1. Commercial condition — fixed total price

The Phase 1 MVP **fixed total implementation price is USD 3,600**. Any reference in the attached v1.0 release to **MYR 15,000** is superseded and shall not be used for quotation, invoicing, milestone calculation or acceptance. The final signed Agreement/approved commercial terms shall reflect the same USD 3,600 total and exclusively control milestone allocation, payment timing/currency, liability, termination, governing law and dispute resolution.

2. Traceability universe

The implementation and acceptance baseline comprises the **594 preserved atomic source-record requirements** together with all applicable controlled corrections/overlays and their named acceptance evidence. A developer may not satisfy an obsolete historical row while ignoring a later controlled correction. "Covered" is not equivalent to accepted unless the current canonical artifact and required test/evidence pass.

3. Assessment validation alignment

The assessment remains **73 questions / 13 modules**, with the approved required/optional structure and 40 scoring-eligible questions. C-01 v1.0.1 controls validation. Required multi-select questions require one or more approved option IDs; an empty array is invalid. NONE/N/A is exclusive where provided. **Q73 allow_na=False** and remains governed by the canonical optional free-text/sanitization rules.

4. Scoring, drivers and report-state alignment

C-02/C-03 v1.0.1 control deterministic scoring and report rendering. Driver output supports **zero to three output entries**; an eligible co-primary pair is one output entry. No duplicate, ineligible/null fallback, invented driver or invented protective factor is permitted. **BIO_STATE** identifies Biological State; **BS** remains exclusively Biological Safety Signals™. Reduced/Not Available states must be supported where canonical data are insufficient.

5. UI/UX authority — 48 families / 192 frames

The required coverage remains **48 screen/state families × four controlled widths (360/768/1024/1440) = 192 frames**. The supplied SVGs are **FUNCTIONAL AND CONTENT WIREFRAMES — NOT FINAL VISUAL DESIGN**. They control approved content/required elements/screen-state identity/flow and functional intent where applicable, not final aesthetics, composition, visual hierarchy, typography, spacing, color, component appearance or art direction.

6. Golden Screen and editable Figma gate

Final visual authority is **ROOTS-AI Visual Direction → written-approved PUB-01 Golden Screen in a ROOTS-owned editable Figma workspace/file → approved downstream design system/screens**. No remaining screen may be visually finalized in bulk before written ROOTS-AI approval of PUB-01. Final handoff must include the approved editable design sources, components/tokens/states/responsive rules and required asset provenance/licensing evidence.

7. Visual acceptance

Visual regression for final aesthetics shall be measured against the written-approved Golden Screen-derived design system and approved downstream Figma screens, not pixel-for-pixel against legacy SVG wireframes. The SVG inventory remains a coverage/content/function reference. Accessibility, responsive evidence and controlled screen/state coverage remain binding.

8. Proprietary package / screen-asset wording

Where the attached release refers to proprietary "screen assets," interpret this as controlled functional screen/wireframe references unless an asset is separately approved as a production visual source. Final visual assets and editable design sources are governed by the approved Golden Screen/design handoff and applicable ownership/license manifest.

9. Preserved conditions

This correction does not reduce the existing requirements for the 19-section web/PDF report, 30 Golden Tests, 12 RLS negative tests, ≥80% business-logic test coverage, report-performance target, zero Critical/High security defects, ROOTS-owned accounts/repository, continuous commits, no code withholding, approved-team access restriction, full handover, 90-day implementation-defect warranty, or the stated Phase 1 out-of-scope features. The existing delivery schedule remains subject to final consistency with the signed Agreement and does not independently redefine Agreement milestone acceptance.

Precedence: where the attached v1.0 pages conflict with this correction on the matters above, v1.0.1 controls. The final signed Agreement remains the controlling legal instrument for commercial/legal terms and shall be aligned to the USD 3,600 total before final package issuance.

PHASE 1 MVP

Detailed Pre-Qualification Scope
and Mandatory Delivery Conditions

Document field	Controlled value
Prepared for	Selected Technology Development Partner
Prepared by	ROOTS-AI™
Version / date	Version 1.0 / 17 August 2026
Status	Issued for written pre-qualification acceptance
Commercial baseline	MYR 15,000 fixed total price / 30 calendar days

IMPORTANT: This non-confidential brief is used to confirm understanding and acceptance before any meeting or release of proprietary implementation files. It does not replace the controlled implementation package or the final signed agreement.

UNDERSTANDING BIOLOGY BEFORE DISEASE

1. Purpose and Qualification Sequence

This document provides the complete non-confidential scope, delivery framework and mandatory acceptance conditions that apply to the ROOTS-AI™ Phase 1 MVP vendor-selection process. Its purpose is to prevent under-scoping, ambiguous estimates and later claims that documented requirements were not understood.

The qualification sequence is mandatory:

- Vendor reviews this brief in full.
- Vendor confirms written acceptance and identifies every assumption, exclusion or reservation.
- ROOTS-AI™ decides whether the vendor proceeds to the next qualification stage.
- Only shortlisted vendors may later attend a technical verification meeting.
- The proprietary implementation package is released only after the required confidentiality process.
- Before coding, the selected vendor performs formal baseline review and records genuine contradictions or missing dependencies.

No meeting or confidential package is authorized merely because a proposal was submitted. Written acceptance of this brief is the current gate.

2. Product Summary

ROOTS-AI™ Phase 1 is an English-first, mobile-first, questionnaire-driven biological intelligence and preventive wellness platform. It is not a diagnostic system and is not a generic AI chatbot. It combines a controlled assessment, deterministic scoring, governed interpretation, personalized reporting and a responsive public website.

The MVP is complete only when:

- All approved MVP pages and screen states are implemented.
- The assessment operates exactly as specified.
- Scoring and report generation are operational and reproducible.
- User Acceptance Testing is approved in writing.
- All Critical and High-severity defects are resolved.
- Documentation, deployment materials and knowledge transfer are delivered.

3. Quantified Controlled Baseline

Baseline element	Required quantity / rule
Atomic requirements	Approximately 594, traceable to implementation and test evidence
Assessment	73 questions across 13 modules
Question status	71 required, 2 optional, 40 scoring-eligible
Scoring domains	7 biological domains
Report	19 defined sections in matching web and PDF formats
UI scope	48 defined screen views and 192 supplied SVG frames
Responsive breakpoints	360, 768, 1024 and 1440 pixels
Reference testing	30 numerical Golden Tests
Security testing	12 negative Row-Level Security cases plus applicable authorization tests

4. Complete Functional Scope

4.1 Public website

- Responsive Home, Assessment, Example Report, How It Works, Pilot Program, Contact and required legal pages.
- Approved navigation, calls to action, forms, content, footer, metadata, analytics and error handling.

4.2 Authentication and user access

- Passwordless Magic Link and Google OAuth.
- Email verification, secure sessions, expiry, revocation, replay protection, state, nonce, PKCE, redirect allow-listing and rate limiting.
- Duplicate-account prevention, logout, unlinking and account-deletion flows as specified.

4.3 Assessment experience

- Eligibility, privacy and consent steps; 73 questions in 13 modules.
- Validation, progress, autosave, safe resume, submission and confirmation.
- Loading, empty, validation, error, success and offline states.
- Exact canonical parity for identifiers, order, values, labels, required flags and scoring eligibility.

4.4 Deterministic scoring engine

- Versioned server-side rules for weights, thresholds, reverse scoring, coverage, missing values, not-applicable values, conflicts and null conditions.
- Calculations for seven domains, Biological State and Recovery Potential as defined in the controlled package.
- AI is never in the scoring path and may not calculate, estimate, replace or modify authoritative results.

4.5 Personalized report

- A 19-section personalized report available as responsive web output and downloadable PDF.
- One immutable, versioned report object is the sole source for both formats.
- Scores, classifications, interpretations, recommendations, charts, disclosures and version identifiers must remain consistent.
- The controlled Reviewer Addendum remains separate from the user-facing report and is restricted to authorized access.

4. Complete Functional Scope - continued

4.6 Controlled AI layer

- AI receives only validated precomputed results and approved content identifiers.
- AI output is constrained by an approved schema and contains no authoritative score-bearing fields.
- Prohibited-language controls, validation, retry, timeout, deterministic fallback and model/prompt versioning are mandatory.
- AI provider latency or failure must not permit numerical changes or indefinite user waiting.

4.7 Database, APIs and permissions

- Supabase/PostgreSQL, SQL migrations, ERD, OpenAPI, JSON Schemas and controlled server-side operations.
- Row-Level Security and least-privilege permissions for every protected data path.
- Browser roles may not directly create or alter authoritative scores, final reports or protected audit records.

4.8 Privacy, consent and research controls

- Separate, versioned consent; withdrawal; access; deletion; retention and audit controls.
- Purpose-limited, de-identified or pseudonymized research exports with applicable suppression, checksum, recipient, expiry and deletion controls.
- Production user data may not be used for development or testing without written authorization.

4.9 UI/UX implementation

- Implementation of 48 screen views and 192 supplied SVG frames using reusable components and the controlled design system.
- Accurate responsive behaviour at 360, 768, 1024 and 1440 pixels.
- Accessibility, visual-regression and cross-browser requirements apply.
- Material changes to approved designs require prior written authorization.

4.10 Testing, deployment and handover

- Unit, integration, end-to-end, API contract, scoring, report parity, security, RLS, responsive, accessibility and visual-regression testing.
- Production deployment, monitoring, error logging, build instructions, operational documentation and knowledge transfer.

5. Required Technical Foundation

Layer	Required foundation
Frontend	React, Next.js and TypeScript; responsive reusable components
Data	Supabase and PostgreSQL with migrations, RLS and least privilege
Interfaces	REST APIs, OpenAPI and JSON Schema validation
Authentication	Magic Link and Google OAuth with defined security controls
AI	Structured output with deterministic boundaries, validation and fallback
Reporting	Canonical immutable report object; matching web/PDF output
Delivery	ROOTS-AI™ GitHub, CI/CD and ROOTS-AI™-owned cloud accounts

6. Delivery Schedule and Acceptance Gates

The delivery period is 30 calendar days from formal approval of the project start gate. Faster internal implementation does not reduce the required testing, UAT or handover obligations.

Period	Required outcome
Day 0	Baseline receipt, ROOTS-AI™ accounts, repository access and approved start gate
Days 1-22	Implementation, continuous commits, automated testing and evidence generation
Day 23	Feature-complete Release Candidate deployed to staging
Days 24-30	Formal UAT, corrections, production deployment and handover
Day 30	Final delivery package complete; written acceptance remains subject to passed criteria

Release Candidate means:

- The entire approved functional scope is implemented and deployed to staging.
- Required automated tests and draft acceptance evidence are available.
- No unresolved Critical or High-severity defect prevents UAT.
- It is not a prototype, partial demo, design preview or collection of screenshots.

7. Commercial and Milestone Conditions

Commercial item	Mandatory condition
Total price	MYR 15,000 fixed total price for the complete documented baseline
Payment basis	Acceptance-based milestones only; funding or time passage is not acceptance
Scope protection	Documented requirements cannot later become additional charges
Change control	Only a ROOTS-AI™ -approved written change order may change scope, price or time
Warranty	90-day implementation-defect warranty after final written acceptance

Payment, silence, staging access, screenshots, partial use or the passage of time do not constitute acceptance. Acceptance is issued only in writing after the applicable evidence and tests pass.

8. Mandatory Acceptance Criteria

- Exact questionnaire, canonical-data and scoring parity.
- Passing all 30 numerical Golden Tests and all applicable canonical parity checks.
- Passing the 12 defined negative RLS cases and other authorization tests.
- At least 80% automated test coverage of business logic.
- Report availability within 15 seconds in at least 95% of approved staging test cases, using the approved timeout, retry and fallback architecture.
- Matching values and controlled content in web and PDF outputs.
- Zero unresolved Critical or High-severity security defects at acceptance.
- Responsive operation on approved devices, breakpoints and current major browsers.
- Successful UAT, documentation delivery and knowledge transfer.

9. Ownership, Team and Handover

- All repositories, hosting, database, AI, email, monitoring, domain and production service accounts are owned and controlled by ROOTS-AI™ from Day 0.
- Code is committed continuously to the ROOTS-AI™ repository. Withholding code until final payment is prohibited.
- All code, configurations, tests, schemas, assets, documentation and project outputs are assigned exclusively to ROOTS-AI™.
- Only the execution team identified in the vendor's written proposal and approved by ROOTS-AI™ may perform the work. No replacement, additional contributor or subcontractor may be used without prior written approval.
- Approval of an additional resource does not increase the fixed price or extend the schedule unless ROOTS-AI™ separately changes the approved scope in writing.
- The delivery team creates and maintains requirement-to-implementation-to-test mapping, executes required tests and supplies complete acceptance evidence.
- ROOTS-AI™ retains sole authority to issue milestone and final acceptance.

The final handover includes, at minimum:

- Complete source code and repository history.
- Build, environment and deployment instructions.
- OpenAPI, schemas, migrations, ERD and RLS policies.
- Automated tests, results and traceability evidence.
- Credential and account inventory without exposing secrets in documents.
- Operational, monitoring, backup and recovery guidance.
- Knowledge-transfer session enabling independent ROOTS-AI™ operation.

10. Out of Scope for Phase 1

The following are excluded unless added through a written change order:

- DNA, microbiome and laboratory analysis or integrations.
- Wearable-device integration and real-time biological monitoring.
- Full clinical portal, enterprise dashboard and population-health platform.
- Biological Twin™, autonomous AI Coach™, marketplace and multilingual implementation.

11. Controlled Package and Baseline Review

The proprietary package contains the authoritative questions, scoring specifications, reference values, screen assets, website and report content, legal text, AI controls, technical schemas and acceptance evidence definitions. This brief summarizes the obligation but does not disclose proprietary implementation content.

During formal baseline review, the selected vendor must identify any genuine contradiction or missing dependency before coding. A documented requirement, normal implementation effort, provider variability, team-capacity issue or overlooked test is not a valid later exclusion. The vendor may withdraw at the review gate if a genuine blocker cannot be resolved; otherwise the accepted baseline governs delivery.

12. Required Written Acceptance

After reviewing every page, the proposed vendor must reply through the approved project communication channel using the declaration below and must list any reservation immediately.

We confirm that we have reviewed the ROOTS-AI™ Phase 1 Detailed Pre-Qualification Scope and Mandatory Delivery Conditions, Version 1.0, in full. We accept the complete Phase 1 scope, approximately 594 traceable requirements, stated acceptance criteria, fixed total price of MYR 15,000, 30-calendar-day schedule, Release Candidate by Day 23, UAT during Days 24-30, ROOTS-AI™ ownership requirements, approved-team restriction, complete handover obligations and 90-day implementation-defect warranty in principle. During formal baseline review, we may identify only genuine documented contradictions or missing dependencies. Existing documented requirements will not become additional scope, cost or time.

The reply must also state one of the following:

- No assumptions, exclusions or reservations.
- A complete numbered list of every assumption, exclusion or reservation.

Only after ROOTS-AI™ records complete written acceptance will the vendor be considered for the next qualification stage. This document does not itself appoint the vendor or authorize work.

END OF DOCUMENT
